# PL-WM TRACKSETTER

## The simply safe track

**The PL-WM impresses with its amazingly simple handling and its versatile application options. Efficient preparation of skating slopes, classic cross-country-, hiking- and riding trails has never been so easy.**

When developing the PL-WM, the focus was on versatility paired with easy handling. The construction is specially designed for snowmobiles and quads with tracks. The intelligent weight distribution on the one hand and the excellent gliding properties on the other ensure that neither the pulling power nor the maneuverability of the towing vehicle are impaired. The PL-WM is available in four versions and can easily be retrofitted or converted. In order to increase the compaction effect even further, the track plate can be loaded with one to three additional weights.

The Schleipfus create a perfect trail in soft snow conditions. The performance of the Bächler cross-country tracksetter can be increased with the RENOVATOR. The special protractor tear open the old trodden track and this can be prepared in the same pass to a new, stable and durable trail. In combination with the Finisher Board, the slope is leveled and a flat finish is realized.
